Subject: Choosing Django REST Framework (DRF) and HTMX for a PDF E-Signing System

Dear [Recipient's Name],

I hope this letter finds you well. I am writing to propose the use of **Django REST Framework (DRF) and HTMX** for the development of our **PDF e-signing system**. After careful evaluation, I strongly believe that this technology stack provides the most efficient, secure, and scalable approach to handling e-signatures while ensuring a seamless user experience.

1. Lightweight and Fast Performance

Unlike traditional front-end frameworks like React or Vue, **HTMX enhances Django's server-rendered approach** by enabling **dynamic updates without full-page reloads**. This results in a **fast and responsive** experience without requiring a separate JavaScript-heavy frontend.

2. Simplified PDF Processing

PDF operations such as **detecting placeholders (zc-sign), merging signatures, and handling document modifications** are **backend-intensive** tasks. Since DRF directly handles API requests, it eliminates the need to send complex JSON data to a frontend, ensuring:

- **Accurate placeholder detection** using PyMuPDF or pdfminer.
- **Backend signature placement**, ensuring precision and security.
- **Direct PDF modifications**, reducing latency and preventing unnecessary frontend dependencies.

3. Secure and Controlled Signing Process

Security is a top priority in an e-signing system. With **DRF handling authentication and user sessions**, we benefit from:
